

TITANOS

PRIVATE WEALTH OPERATING SYSTEM

Capability Overview

28 July 2026 · Confidential

TitanOS is the operating system behind a modern advisory firm: one place for a client's whole balance sheet, documents attached to the numbers they support, an assistant that answers from the firm's own records, and workflows that carry recurring obligations to completion under human approval.

Every firm runs in its own isolated environment under its own brand. PCM Family Office is the pilot client.

Reading the status column

LIVE	In production today, carrying real client data
DEMO	Built and working on the demonstration instance
BUILDING	In active development

1. White-label, genuinely

The product is TitanOS. Every firm — including PCM — is a tenant that supplies its own identity. Nothing in the codebase treats one firm as special.

Capability	Status
Brand name, logo, tagline and full colour palette per tenant	LIVE
Runtime brand switching from an admin screen — no rebuild, no developer	DEMO
Several saved brands, switched in one click, for concurrent sales cycles	DEMO
Branding carries through to exported PDFs, print reports and outbound email	LIVE
Branded link previews, favicons and browser chrome per tenant	LIVE
Dedicated database per firm — no shared tables, no shared rows	LIVE

Every client firm gets an isolated environment with its own database, provisioned in under a day, carrying their brand end to end — down to the PDF a client opens on their phone.

2. One place for the whole balance sheet

Capability	Status
Properties with loan, tax, insurance, flood and rental detail	LIVE
Portfolio accounts, with lines of credit correctly excluded from asset totals	LIVE
Valuables, flagged insured or not scheduled	LIVE
Cash flow modelling with tax treatment and multi-year projection	LIVE
Deals pipeline and prospect tracking	LIVE
Tasks, deadlines and recurring obligations	LIVE
Professional contacts and property vendors, click to call and click to email	LIVE

3. Documents attached to the numbers

Most platforms give you a folder. This links a document to the figure it supports.

Capability	Status
Vault organised into folders by category	LIVE
AI reads uploaded documents — embedded text, and OCR for scans	LIVE
Documents linked to a specific property section: mortgage, tax bill, insurance declarations, insurance invoice, flood, rental agreement	LIVE
Valuables linked to the schedule that covers them	LIVE
Attach from the figure itself — a paperclip beside Property Taxes opens a pre-filled upload	LIVE
Replacing a document keeps the previous one on file, unlinked, for history	LIVE
Download audit log — who opened which document, and when	LIVE
Time-limited signed links; no permanent public file URLs	LIVE

Demo moment: open a property, click the icon beside the insurance premium, and the declarations page opens. Next year's bill replaces it in two clicks and last year's stays on file.

4. AI that works from the client's own records

Not a chatbot bolted on. It answers from one family's data and names the document it used.

Capability	Status
Per-family assistant answering from that family's records and document contents	LIVE
Strictly scoped to one family — it cannot answer across relationships	LIVE
Floating assistant on every page; firm-wide screens ask which client first	LIVE
Named per family, so the client meets a consistent assistant	LIVE
Scheduled reports on a cadence, delivered as branded PDFs	LIVE
Concierge research — live web search for what a client asked the firm to watch for, with sources	LIVE
Document field extraction to pre-fill property records from a statement	LIVE
Treats document text strictly as data, never as instructions	LIVE

Demo moment: ask "is anything uninsured?" and it names the vehicle missing from the schedule, because it read the endorsement.

5. Workflows: obligations carried to completion

The difference between software that tells you something and software that gets something done.

Capability	Status
Recurring obligations: premiums, estimated tax, RMDs, capital calls, loan payments	LIVE
Nine starter playbooks ship with the product, across four disciplines	LIVE
Lead times measured back from the due date, per playbook	LIVE
Conditional steps — Crummey notices only where the trust requires them	LIVE
Conditions resolved before dates are set, because they change the schedule	LIVE
Flagged at risk on day one when a cycle starts too late to fit its own lead times	LIVE

Capability	Status
Every outbound item held for named human approval	LIVE
Sends from the platform, as the responsible Titan Expert on the firm's own verified domain	LIVE
Supporting documents pulled from the vault and attached to the message	LIVE
Approval and sending recorded separately, each attributed to a named person	LIVE
Sent means the provider accepted it, with a delivery reference recorded	LIVE
Recipients checked against the client's known contacts; an unfamiliar address stops the send	LIVE
A failed send stays in the queue rather than looking successful	LIVE
Re-sending the same instruction twice is not possible	LIVE
Every outbound item copies the family principal, so the client sees what is done in their name	LIVE
Refuses to guess the principal where a family has several members on file	LIVE
Skipped steps stay visible, so nothing looks forgotten	LIVE
Template library in Resources: read the exact playbook before it runs	LIVE
Steps read in plain language — 60 days before, who acts, and to whom	LIVE
Admins edit lead times, actors, recipients and conditions; others read only	LIVE
New playbooks are rows, not code — the firm adds its own	LIVE
Review queue on the dashboard: everything awaiting a person, across the book	LIVE
Playbooks provision from one migration file, identical across every tenant	LIVE

Two things to say out loud: nothing sends without a named approval, and the platform prepares payment instructions but never moves money. Those are the reasons a compliance officer says yes.

6. Roles and permissions enforced at the data layer

Access rules live in the database, so they hold even if the application layer is bypassed.

Capability	Status
Four roles: Admin, Titan Expert, Partner, Client	LIVE
Row-level security per family, enforced in Postgres	LIVE
Titan Experts see only their own book	LIVE
Partners: read-only, per-family grants, document upload only	LIVE
Clients: their own family, read-only	LIVE
Permission changes take effect immediately, including for scheduled automations	LIVE
Per-partner feature permissions, such as who may run scheduled reports	LIVE
Admin screens gated on role at the view, not only in the menu	LIVE
Clients may email their own advisor, never other advisors at the firm	LIVE

7. Client experience

Capability	Status
Branded client portal carrying the firm's identity	LIVE

Capability	Status
Email their advisor from inside the portal; primary advisor always copied	LIVE
Mobile responsive throughout	LIVE
Firm-paid bills marked paid, recording who paid and when	LIVE

8. Operational quality

Unglamorous, and the reason it survives a real deployment.

Capability	Status
Long AI jobs run in the background — no timeouts on multi-minute research	LIVE
Every build stamped; open tabs are told when a newer version is live	LIVE
Cache rules: immutable hashed assets, never-cached entry point	LIVE
Brand artwork versioned, so a replaced logo appears immediately	LIVE
Artwork failure falls back to the brand name rather than a blank header	LIVE
Unsaved brand edits survive leaving the page	DEMO
Unrecognised categories fall into Other rather than hiding an asset	LIVE

Starter playbooks

Playbook	Discipline	Steps	Lead time	Conditional
ILIT Premium Funding	Insurance	9	75 days	Crummey notices
Property Insurance Renewal	Insurance	8	75 days	Market check
Life Insurance In-Force Review	Insurance	8	90 days	Remediation, trust-owned
GRAT Annuity Payment	Trusts & Estates	8	60 days	In-kind, final year
Intra-Family Loan Interest	Trusts & Estates	7	45 days	Maturity within a year
Required Minimum Distribution	Tax	8	90 days	CPA sign-off, charitable
Partnership K-1 Collection	Tax	8	75 days	—
Quarterly Estimated Tax	Tax	5	30 days	CPA sign-off
Private Fund Capital Call	Investments	5	12 days	—

Chosen by consequence of failure rather than frequency. A missed GRAT annuity can unwind the whole structure; unpaid intra-family loan interest can be recharacterised as a gift years later; an unreviewed universal life policy lapses quietly on an elderly insured; a short required distribution carries a penalty; and one late partnership document holds up an entire return. None of them announce themselves, which is exactly why they are worth automating.

Lead times are a considered starting point rather than advice. Deadlines vary by jurisdiction and change with legislation, so each firm should have its own tax and legal counsel confirm them before a playbook runs against a real family. That is one reason playbooks are held as data a firm can edit, not code it cannot.

Known gaps

Named here so they are raised by us rather than discovered by a prospect. Each has a credible answer.

- Cross-firm single sign-on. A Titan Expert serving clients through several branded instances signs into each separately. Deliberate isolation today; central identity is on the roadmap.

- Multi-factor authentication and a full change-history audit. Document downloads and task completions are attributed today; a complete record of field-level changes is not yet built.
- Portfolio statements and cash flow line items are not yet linked to source documents the way properties and valuables are.
- Backup and recovery policy should be stated explicitly for an enterprise buyer.
- Delivery confirmation. The platform records that the email provider accepted a message, which is not the same as it arriving. Bounce and complaint handling is the next piece of work; until then a bounced item would sit looking sent.

Fixed since the last revision, recorded because a technical buyer will probe it: outbound drafts used to take the firm name from a server-side setting, and fell back to the product name if it was unset. The tenant's own deployment now supplies it, so a firm's letters carry the firm's name with nothing to configure.
